Cyclic sulfones are important pharmacophores with a wide range of pharmacological activities owing to a range of mechanisms of action. Their ability to act as conformational constraint, H-acceptor and electron-withdrawing functionality has been used to improve affinity and potency by optimizing the interactions with the target proteins. The polarity associated with sulfones helps to reduce the overall lipophilicity, which in many cases translates into improvements in ADME (absorption, distribution, metabolism and excretion) and pharmaceutical properties. So far, Chemscene has developed many cyclic sulfone building blocks.
